

COUNCIL OF NORTHERN CAVING CLUBS

Important safety information about using CNCC descriptions and rigging topos

This MUST be read and understood by anyone using a CNCC-provided cave description or rigging topo

These descriptions and rigging topos are provided by the CNCC for use by experienced cavers only in assisting with trip planning and route-finding on some of the popular sporting routes in our region. They are not exhaustive, they do not cover every passage or feature, and details may have been greatly simplified to try to keep them concise and clear.

Great efforts have been made to ensure the accuracy and integrity of the information. Nonetheless, there are likely to be errors and (over time) an increasing number of inaccuracies due to changes in the caves and the replacement of resin anchors. The descriptions may also contain subjective viewpoints which could be open to misinterpretation. It is entirely incumbent upon all cavers to exercise appropriate care and caution when going underground using these topos and descriptions, and to have researched the trip from several other sources. Never make any safety critical decisions based on the information in these descriptions or topos.

Pull through trips must only ever be undertaken by cavers who are confident in finding the lower route out of the cave without a description, and who understand the extra precautions demanded of such trips (e.g. carrying multiple ropes).

The rope lengths stated in the rigging topos are considered the minimum length required based on average rigging. There may be errors, or your rigging may use more rope than anticipated. Therefore, it is critical that all ropes that are deployed for use have two tightened knots in both ends, to mitigate against the risks associated with the ropes not reaching the bottom of pitches.

Difficulty ratings, or 'grades' have been omitted from these descriptions. All cavers must make their own informed judgements of whether the cave is suitable for their capabilities, backed up by thorough research into the nature of the cave from numerous sources and an understanding of the capabilities of others in your group.

Many in-site ropes and ladders are mentioned throughout the descriptions. These should only ever be considered navigational markers and not safety critical belays. The CNCC does not install or maintain any fixed aids in caves other than the resin anchors shown on the topos. Never trust your safety to a rope or ladder which is left in a cave. For resin anchors you must understand the importance of belaying your rope to multiple anchors, including full traverse ropes leading to pitches, and always performing a pre-use inspection on every anchor. If any resin anchor shows movement, or fracturing in the nearby rock, it must not be used.

Rigging must always be performed to avoid any rub points or other hazards. Rigging exactly as depicted in the rigging topos does not guarantee a rub-free descent; this must be assessed and ensured by each individual caver on each pitch in every cave.

Many caves which are susceptible to danger from flooding have been highlighted in the descriptions. However, all caves, even typically dry ones, can flood in various circumstances, and it is therefore critical that the experienced caver using these descriptions makes their own judgement based on experience, extensive research and weather forecasts. Decisions to descend any cave after or during wet weather, or when wet weather is forecast, should be made based on an informed judgement backed up by thorough research from multiple sources. The critical moto which should be adhered to is "If in doubt, stay out!"

Although warnings are provided where there are some specific known hazards, the absence of a warning does not indicate that there are no hazards. Caves can (and do) change over time. Furthermore, the CNCC does not perform routine inspections or surveys of caves to look for specific hazards (e.g. loose rocks). All cavers are strongly advised to view the webpage on the CNCC website for their chosen cave to check for any warnings that have come to our attention. Experienced cavers using these descriptions must make their own evaluations for hazards throughout the duration of their trip and act appropriately to mitigate any risks.

Neither the author of the descriptions/topos or the CNCC will accept any responsibility for any damage, injury or loss (however caused) resulting from the use, misuse or misinterpretation of information in these cave descriptions or rigging topos.

JINGLING POT

November 2016

Jingling Pot can be descended in slightly wet conditions, however, following prolonged heavy rain the stream can overflow down the Pot, and it should be avoided under these circumstances.

Parking:

Park on the Kingsdale Road in the layby about 500m north of the track to Braida Garth Farm (just beyond a gate on the left leading into some sheep pens).

Location: Grid reference SD 69890 78372

Go through the gate by the sheep pens and up the steep hill (keeping to the left wall). At the top of the hill you will meet the Turbary Road footpath. Follow the path right for about 300m (just over half way to the next wall), and Jingling Pot is an obvious open pothole on the left, approximately 100m from the path.

Rigging:

The rigging topo from 'Northern Caving' is available on the CNCC website (courtesy of CNCC Technical Group).

Navigation:

There are three possible SRT routes down Jingling Pot and these are best demonstrated in the rigging guide referenced above.

The direct hang route from the surface is belayed from a tree and is currently **NOT RECOMMENDED** owing to the tree being unstable.

The other two routes commence by descending the 'Little Gully'. This starts on the opposite side of the pothole to the trees, and leads down a roped traverse and short pitch down a gully leading towards the main pothole where there are two SRT routes possible:

Direct descent: One route descends straight to the bottom of the shaft from a Y-hang, via a rebelay half way down for a clear hang.

Lateral Cleft: This route takes a traverse across the shaft to a broken descent via several short pitches/rebelays/traverses. This is an excellent, quick trip to start or end the day, with some fine views up from the bottom.

Both routes land at the bottom of the Jingling Pot Shaft. A final pitch involves a traverse on ledges to a Y-hang (but this can be free climbed by experienced cavers) and lands in a chamber. There is no way on from here.
