

COUNCIL OF NORTHERN CAVING CLUBS

Important safety information about using CNCC descriptions and rigging topos

This MUST be read and understood by anyone using a CNCC-provided cave description or rigging topo

These descriptions and rigging topos are provided by the CNCC for use by experienced cavers only in assisting with trip planning and route-finding on some of the popular sporting routes in our region. They are not exhaustive, they do not cover every passage or feature, and details may have been greatly simplified to try to keep them concise and clear.

Great efforts have been made to ensure the accuracy and integrity of the information. Nonetheless, there are likely to be errors and (over time) an increasing number of inaccuracies due to changes in the caves and the replacement of resin anchors. The descriptions may also contain subjective viewpoints which could be open to misinterpretation. It is entirely incumbent upon all cavers to exercise appropriate care and caution when going underground using these topos and descriptions, and to have researched the trip from several other sources. Never make any safety critical decisions based on the information in these descriptions or topos.

Pull through trips must only ever be undertaken by cavers who are confident in finding the lower route out of the cave without a description, and who understand the extra precautions demanded of such trips (e.g. carrying multiple ropes).

The rope lengths stated in the rigging topos are considered the minimum length required based on average rigging. There may be errors, or your rigging may use more rope than anticipated. Therefore, it is critical that all ropes that are deployed for use have two tightened knots in both ends, to mitigate against the risks associated with the ropes not reaching the bottom of pitches.

Difficulty ratings, or 'grades' have been omitted from these descriptions. All cavers must make their own informed judgements of whether the cave is suitable for their capabilities, backed up by thorough research into the nature of the cave from numerous sources and an understanding of the capabilities of others in your group.

Many in-site ropes and ladders are mentioned throughout the descriptions. These should only ever be considered navigational markers and not safety critical belays. The CNCC does not install or maintain any fixed aids in caves other than the resin anchors shown on the topos. Never trust your safety to a rope or ladder which is left in a cave. For resin anchors you must understand the importance of belaying your rope to multiple anchors, including full traverse ropes leading to pitches, and always performing a pre-use inspection on every anchor. If any resin anchor shows movement, or fracturing in the nearby rock, it must not be used.

Rigging must always be performed to avoid any rub points or other hazards. Rigging exactly as depicted in the rigging topos does not guarantee a rub-free descent; this must be assessed and ensured by each individual caver on each pitch in every cave.

Many caves which are susceptible to danger from flooding have been highlighted in the descriptions. However, all caves, even typically dry ones, can flood in various circumstances, and it is therefore critical that the experienced caver using these descriptions makes their own judgement based on experience, extensive research and weather forecasts. Decisions to descend any cave after or during wet weather, or when wet weather is forecast, should be made based on an informed judgement backed up by thorough research from multiple sources. The critical moto which should be adhered to is "If in doubt, stay out!"

Although warnings are provided where there are some specific known hazards, the absence of a warning does not indicate that there are no hazards. Caves can (and do) change over time. Furthermore, the CNCC does not perform routine inspections or surveys of caves to look for specific hazards (e.g. loose rocks). All cavers are strongly advised to view the webpage on the CNCC website for their chosen cave to check for any warnings that have come to our attention. Experienced cavers using these descriptions must make their own evaluations for hazards throughout the duration of their trip and act appropriately to mitigate any risks.

Neither the author of the descriptions/topos or the CNCC will accept any responsibility for any damage, injury or loss (however caused) resulting from the use, misuse or misinterpretation of information in these cave descriptions or rigging topos.

BIRKWITH CAVE

November 2022

Birkwith Cave is the resurgence for the Old Ing, Dismal Hill and Red Moss Pot system. It is therefore very flood responsive and should not be entered following or during wet weather.

Parking:

Parking at High Birkwith Farm is likely to be refused.

Parking may be permitted at Low Birkwith Farm for a goodwill fee, but do not rely on this being available. You may wish to enquire in advance with the farm.

The nearest and best public parking is on the green lane west of the road at the north end of Selside, where cavers traditionally park for Long Churn and Alum Pot. Parking is free (the access fee here is for Alum Pot/Long Churn access), and it is a pleasant 3km walk on public footpaths past Selside Farm and along the south bank of Coppy Gill to reach High Birkwith. Be familiar with the exact access specifics on the CNCC website before your trip, as some discretion around High Birkwith Farm may be required.

How to find: SD 80360 76960

About 300m beyond High Birkwith Farm, the Ribble Way footpath leads off on the right along a wall. Follow this for 100m and then cross another wall. Shortly after, on the right is a cluster of trees. Just within these trees, at the head of a gill, is the large entrance to Birkwith Cave, which is a substantial resurgence.

Discretion is required before departing the public footpath as landowner consented access is unlikely to be given. If challenged, we recommend being courteous and making your way back to the public footpath without fuss.

Navigation:

From the entrance, a varied passage, with crawls, chambers and cascades continues for about 150m to a T-junction.

Right (upstream) enters a canal where swimming is required. After about 100m this reaches a dead end near the sump through to Dismal Hill Cave.

Left (downstream) is an arduous 250m crawl with sections of canal, leading to pile of boulders marking the position of a manhole near Coppy Gill Cave. This may be blocked by flood debris, but if possible it emerges just next to the public right of way above High Birkwith Farm.
